DETAILED ACTION

Priority

Applicant's claim for domestic priority under 35 U.S.C. 119(e) is acknowledged based upon the provisional application 60/197,588 filed on 4/17/2000.

Information Disclosure Statement

The information disclosure statement (IDS) submitted on 2/04/2004 is in compliance with the provisions of 37 CFR 1.97. Accordingly, the information disclosure statement has been considered by the examiner.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Lee et al. [U.S. Pat. 6,621,809] and further in view of Lee et al. [U.S. Pat. 6,674,739].

Regarding claims 1,2,13,14,18, Lee et al.('809) discloses a first control channel (col. 8, lines 18-20 – F-DCCH) communicating a first set of control information (col. 8, lines 31-34 – power control bit) to at least one component within the communication system and a second control channel (col. 8, lines 15-18 – F-CCCH) communicating a second set of control information (col. 8, line line 47 – demultiplexed data) to at least one component within the communication system.

Art Unit: 2664

Lee et al.('809) further discloses transmitting a channel assignment message that contains an orthogonal code. (col. 10, lines 55-62)

Lee et al. ('809) fails to disclose what channel the channel assignment message is transmitted on.

Lee et al. ('739) discloses transmitting a spreading code, which is orthogonal, on a forward common channel for identification of a reverse common channel. (col. 3, line 60 – col. 4, line 1)

One skilled in the art would know that the transmission of the spreading code of the reverse channel is selective of the reverse channel amongst all the other channels that are being transmitted knowing that CDMA transmits multiple channels at the same time only being seperated by a code.

It would have been obvious for one of ordinary skill in the art at the time of invention to transmit the orthogonal code on the first control channel so that the mobile could pick up the second control channel, otherwise the invention would fail to operate because the mobile would have no way of acquiring the channel.

Regarding claims 3,15, Lee et al. ('809) further discloses the first set of control information further includes dedicated control information. (col. 8, lines 18-20 – F-DCCH)

Regarding claims 4,16, Lee et al. ('809) further discloses the dedicated control information includes at least one of power control information and reverse link scheduling information. (col. 8, lines 31-34 – power control bit; col. 8, lines 41-42)

Art Unit: 2664

Regarding claims 5,19, Lee et al. ('739) further discloses the first set of control information includes at least one of a starting Walsh code assignment of the data channel, information concerning the modulation type of the data channel, a coding rate and message sequence length. (('809)col. 10, lines 55-62; - walsh code ('739)col. 3, line 65 – a spreading code is a walsh code)

Regarding claims 6,17, Lee et al. ('809) further discloses the second control channel is a shared control channel selected from a plurality of pooled shared control channels(col. 8, lines 11-14 – pilot channel and FCCH are both pool shared control channels) based on the indicator value. (col. 10, lines 55-62)

Regarding claims 7,20, Lee et al. ('809) further discloses the second set of control information includes at least one of information for demodulating information transmitted on the data channel(col. 10, lines 55-62 - the walsh code is used for demodulating), gain information(col. 8, lines 31-34 – power control bit), and ARQ information.

Regarding claims 8,21, Lee et al. ('809) further discloses the communication system is a code division multiple access system. (title)

Regarding claims 9,22, Lee et al. ('809) further discloses the first and second control channels are part of a forward link in the code division multiple access system. (col. 8, lines 15-20 both are forward)

Regarding claims 10,23,25, Lee et al. ('809) further discloses the first set of control information includes an indicator value that is used by the communication

Application/Control Number: 09/703,775 Page 5

Art Unit: 2664

system to indicate that the second set of control information on the second control channel is not transmitted to the at least one component. (col. 13, lines 40-44)

Regarding claims 11,24, Lee et al. ('809) further discloses transmitting data on a data channel to the at least one component; and wherein the first set of control information includes an indicator value that is used by the communication system to indicate that the second set of control information on the second control channel is transmitted to the at least one component, to identify the second control channel and to indicate that data on the data channel is not transmitted to the at least one component. (col. 13, lines 40-44)

Regarding claims 12,25,26 Lee et al. ('809) further discloses transmitting data on a data channel to the at least one component; and wherein the first set of control information includes an indicator value that is used by the communication system to indicate that the second set of control information on the second control channel is not transmitted to the at least one component and data on the data channel is not transmitted to the at least one component. (col. 13, lines 40-44)

Regarding claims 12,25,27, Lee et al. ('809) further discloses transmitting data on a data channel to the at least one component; and wherein the first set of control information includes an indicator value that is used by the communication system to indicate that the second set of control information on the second control channel is not transmitted to the at least one component and data on the data channel is not transmitted to the at least one component. (col. 13, lines 40-44)

Conclusion

Art Unit: 2664

Any inquiry concerning this communication or earlier communications from the examiner should be directed to William C. Schultz whose telephone number is 703-305-2367. The examiner can normally be reached on M-F(7-4)(first bi-week) M-Th(7-4)(second bi-week).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Wellington Chin can be reached on 703-305-4366. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
